## **QUAD ZONE LOGIC**

Optex improves its patented "Multifocus Optics" technology to create "Quad Zone Logic" for accurate detection of humans. Using this logic the RX-40PI has been designed to give extremely high false alarm protection with tolerance to spot temperature changes from curtains or small to medium size animals. Optex's Optical Quad Technology uses taller detection zones divided into upper and lower areas. It detects IR energy changes in both areas and then couples them for extremely accurate detections. Offering very high reliability in hostile areas.

## FEATURES

### TECHNOLOGY FOR HIGHEST RELIABILITY

#### ●Quad Zone Logic - Recognized Humans and Ignores Most Small Animals

Quad Zone Logic provides multi segmented detection zones over the detection area. An alarm signal is created by the cumulated total IR energy of each zone. It is designed so that a human size target will normally fill 4 to 8 zones, and this will cause an alarm to be generated. Any smaller temperature change (i.e. small to medium size pets, rodents or moving curtains) only activates one or two zones at the same time creating a much weaker detection signal. Pet immunity applies to animals 0 to 16 inches in height. These signals are further analyzed by the "ECO" Chip and signal processing circuit for accurate detection of humans and avoidance of most small animals.

#### ●Spherical Lens

##### - Technology to Back Up Quad Zone Logic

Obtains an accurate focal length for each detection zone and maximizes the performance of Quad Zone Logic.

## TROUBLE-FREE & EASY INSTALLATION

●Sealed Housing  
Prevents drafts and insects from reaching the pyro element.

●Trouble-Free & Easy Knockouts  
Simply push with a screwdriver to open a hole of matching size with the cables.

- Durable Spherical Lens and Housing Design
- Good Wiring Space and Guide
- Selectable Pulse Count : 2 or 4
- LED On/Off Switch

## PERFORMANCE

●RFI Protection  
No alarm at 20V/m from 100MHz to 1 GHz

●Temperature Compensation Logic  
Eco chip includes temperature compensation circuit. It controls sensitivity to improve stability against changes in environmental conditions.
